

Basic Disk-Related Commands in Linux

As a Linux user, you need to have a good understanding of disk space and usage. In this presentation, we explore two simple yet powerful disk-related commands, `du` and `df`, that will help you manage your disk space effectively.

 **by dummy**

```
tem, 0.0% interrupt, 100% idle
tem, 0.0% interrupt, 100% idle
wap: 0K/2055M used/tot
```

| JAIT | TIME | CPU | COMMAND |
|--------|------|-------|----------|
| poll | 0:06 | 0.00% | mpd |
| poll | 1:34 | 0.00% | mpd |
| poll | 0:00 | 0.00% | mpd |
| poll | 0:00 | 0.00% | scmpc |
| kqread | 0:00 | 0.00% | apmd |
| select | 0:00 | 0.00% | httpd |
| select | 0:00 | 0.00% | sendmail |
| poll | 0:01 | 0.00% | logfmon |
| select | 0:02 | 0.00% | sshd |
| nfsd | 0:02 | 0.00% | nfsd |
| nfsd | 0:01 | 0.00% | nfsd |
| poll | 0:00 | 0.00% | tmux |
| select | 0:00 | 0.00% | cron |
| ttyin | 0:00 | 0.00% | ksh |
| poll | 0:00 | 0.00% | syslogd |
| poll | 0:00 | 0.00% | ncmpc |
| select | 0:00 | 0.00% | emacs |

Using the du Command

What is du command?

The du command stands for “ disk usage” and it is used to estimate disk space usage of a file or directory.

How to use du command?

Syntax: du [options]
[pathname]. For example:
du -sh
/home/username/mydir/

What are its key features?

The du command can display sizes of individual files as well as directories, and you can sort the output based on the sizes to get a better analysis of disk usage.

Using the df Command

```
Changes will remain in memory only, until you decide to write them.
Be careful before using the write command.

Device does not contain a recognized partition table
Building a new DOS disklabel with disk identifier 0x2e0c9d1.

Command (m for help): n
Command action
a toggle a bootable flag
b edit bsd disklabel
c toggle the dos compatibility flag
d delete a partition
g create a new empty GPT partition table
G create an IRIX (SGI) partition table
l list known partition types
m print this menu
n add a new partition
o create a new empty DOS partition table
p print the partition table
q quit without saving changes
z create a new empty Sun disklabel
t change a partition's system id
u change display/entry units
v verify the partition table
w write table to disk and exit
x extra functionality (experts only)

Command (m for help): n
Partition type:
p primary (0 primary, 0 extended, 4 free)
e extended
Select (default p): p
Partition number (1-4, default 1):
First sector (2048-20971519, default 2048):
Last sector (2048-20971519, default 2048):
```

What is df command?

The df command stands for “disk free” and it is used to display information about total and available disk space on a file system.

How to use df command?

Syntax: df [options] [file system]. For example: df -h

What are its key features?

The df command displays information about the file system containing each file name argument and the space available on that file system. This command is often used with several options to display disk usage in a human-readable format.

du vs df: What's the Difference?

Sorting Output with du Command

1

Sort by size

Use the `-s` option to sort output in order of total file sizes in each directory. You can also use `--sort` option to specify different sorting methods.

2

Limit search depth

You can limit the search depth of your analysis with the `--max-depth` flag, which tells `du` to analyze files and directories only to a certain level of depth.

3

Exclude specific files and directories

If you want to exclude specific files or directories from your analysis, use the `--exclude` flag followed by the name of the file or directory you want to ignore.

df Command: Useful Tips

Check Disk Usage

Use the `df -h` command to obtain a summary of the disk space utilization of all mounted file systems in the human-readable format.

Display Inodes

The `df -i` option is used to view the number of inodes used and those available on a file system.

Specific File System Usage

You can display the information for a specific file system using the `df` command with the name of the mount point for that file system.

Keeping Your Disk Space Clean

Automate Maintenance

Consider using an automated tool to regularly clean your disk. For example, [Janitor](#) is a cleaning tool for Linux that runs automatically and removes temporary files, cache, installation remnants, logs, and old backups.

Regular manual cleaning

Be mindful of the files you're storing on your computer. Clean up old and duplicate files periodically. Consider shredding or deleting sensitive data that is no longer needed.

Emptying your trash

Emptying your trash regularly is an easy way to free up disk space. Make sure to check that the contents of your trash can be safely deleted.

Conclusion

Importance of Disk Space Management

Effective management of disk space is key to the optimal performance of your Linux system. The `du` and `df` commands are powerful tools that can help you monitor and analyze your disk space usage and keep your system well-organized.

Regular Maintenance is Key!

Take a proactive approach to disk management by regularly monitoring and optimizing your disk space usage. This will not only improve performance but also prevent data loss and other recurring issues.
